Lab 05 – Contribution Journal
ITAI 1371 – Introduction to Machine Learning
Group 4

Member 1: Patrick Rostand Gandjouon Tchassem

For Lab 05, I contributed by reviewing the notebook, checking the code, and making sure the required tasks were completed correctly. I went through the different sections, including handling missing values, One-Hot Encoding, and Feature Scaling. I checked the outputs to make sure they matched what the instructions were asking us to accomplish.

One of the corrections I made was updating the code used to fill missing values in the Age column. The original code produced a warning, so I changed it to a better method and ran the cell again to confirm that it worked correctly. I also reviewed the three Knowledge Check questions and compared the answers with our actual code and outputs to make sure they were accurate.

In addition, I worked on improving the PDF formatting so that the code, explanations, and results were easier to read. I also helped organize the GitHub submission by preparing separate Markdown files for the reflective journal and contribution journal, allowing each group member to add their individual work. My goal was to help make sure our group submitted a complete, organized, and properly formatted assignment.

Member 2: Saimi Manasiya
I contributed to the Lab 05 group assignment by participating in the data preparation process and learning about the different steps involved in preparing the Titanic dataset. I worked with my team members to understand how to handle missing values, encode categorical data, and scale numerical features. I also participated in group discussions, shared ideas, and helped my teammates understand the concepts involved in the lab.

Through this assignment, I improved my practical knowledge of Python and pandas and learned how to prepare data before using it in machine learning. I understood the importance of checking data quality, handling missing information correctly, and organizing the dataset properly. I also learned how teamwork, communication, and sharing responsibilities help complete a group assignment successfully. Overall, this lab helped me improve my technical skills and gain a better understanding of the data preparation process.

Contribution:
For Lab 5, my focus was on One-Hot Encoding. I contributed to the team by converting the categorical features into numerical values using the One-Hot Encoding technique. This transformation is a necessary step for the data preparation process because machine learning models are mathematical and require numbers instead of text. I converted categorical columns such as Sex and Embarked into a numerical format using the One-Hot Encoding technique. This method turns categorical values into numerical values like 1 and 0, and transforms the text fields into binary True and False indicators. Finally, I verified the encoded features to ensure the Sex and Embarked columns successfully transformed into clean numerical indicators

My assigned contribution to the Module 05 group lab is Dataset Setup and Initial Review. My role is to
load the Titanic dataset into a pandas DataFrame, examine its structure, and check the column types

and missing-value counts. This initial review will help the group understand which columns contain numbers, which contain categories, and where information is missing before making changes. I am also responsible for checking that the setup cell runs correctly so the other members can continue with the same starting data.

The main purpose of my part is to give the group a clear starting point for data preparation. I will summarize the issues found during the initial checks and identify what needs attention in the later steps, especially missing ages and categorical columns such as Sex and Embarked. Before handing over my section, I will make sure the initial outputs are visible and easy to understand. My contribution supports the members handling imputation, encoding, and scaling by helping them see why those steps are needed.

L05-Contribution

In the assignment for the week, my personal contribution was to do my indepedent part of the google colab. I further worked on the
assignment in detail for personal knowledge, so once I completed the module, I broke it down in sections, and analyzed each individual
task seperatley to understand what each step was really accomplishing. In addittion, I tried to handle my reflection and contribution
before the due date, so my group would not be backed up in submitting the module. I also helped out in contributing when members had
questions or updates on assignments by communicating when able to.
